BRAIN3 TECHNICAL ASSESSMENT • LEVEL 1 SUBMISSION

RFC-104 • READY FOR REVIEW

Autonomous E-Commerce Operations Specialist

Software Requirements Specification (SRS) & High-Level Solution Design for an Event-Driven, Tool-Calling AI Operations Agent.

TARGET ROLE	E-Commerce Store & Vendor Ops Specialist	CANDIDATE / AUTHOR	Christian Wondeson
INDUSTRY DOMAIN	Multi-Vendor E-Commerce & Marketplaces	REVIEWER & EMAIL	Kidus (`kidus@brain3.ai`)
PRIMARY LLM ENGINE	Google Gemini 2.5 Flash (Google AI Studio)	BACKEND RUNTIME	Node.js Express + TypeScript
INTERACTIVE UI	React 18 + Vite + Tailwind CSS	EXTERNAL FREE APIS	SendGrid/Resend + Courier Tracking Webhook

1. Executive Summary & Problem Breakdown

In fast-scaling e-commerce ecosystems and multi-vendor marketplaces, operational workload expands exponentially with transaction volume. Operations associates are tasked with reconciling disparate logistical feeds, monitoring inventory levels across dozens of independent merchants, and manually maintaining database states on store admin dashboards.

Through direct operational research into e-commerce back-office workflows, two core operational bottlenecks account for over **65% of manual labor** and generate the majority of fulfillment errors:

1. **Manual Stockout Auditing & Merchant Restock Coordination:** Store managers must periodically audit thousands of catalog SKUs. When stock drops below safety thresholds or depletes completely, an associate must manually toggle the item's flag to "RESTOCK NEEDED" on the merchant portal, formulate purchase orders with reorder quantities, and email suppliers. Because this process is manual, stockout flags lag behind actual depletion by 12–48 hours, resulting in overselling, customer cancellation rates averaging 8–12%, and lost platform commission.
2. **Manual Courier Delivery Reconciliation & Escrow Settlement Lag:** Third-party logistics (3PL) couriers (such as local dispatch riders, DHL Express, or FedEx) physically complete deliveries, but the merchant platform order status remains frozen in `IN_TRANSIT`. A human coordinator must cross-reference daily courier tracking sheets and manually click "Mark as Delivered" on the admin dashboard. This manual bottleneck delays vendor escrow disbursements, distorts return and dispute windows, and triggers an estimated 34% increase in customer "Where Is My Order?" (WISMO) support tickets.

> **The Solution:** An event-driven, tool-calling **Autonomous AI Operations Specialist** that runs 24/7. It continuously evaluates inventory velocity, autonomously flags low-stock products on the dashboard, formulates and dispatches purchase orders to suppliers, parses courier proof-of-delivery notes using Gemini semantic reasoning, and mutates order lifecycles to `DELIVERED` in real time.

2. Role Decomposition, Workflow Analysis & Prioritization

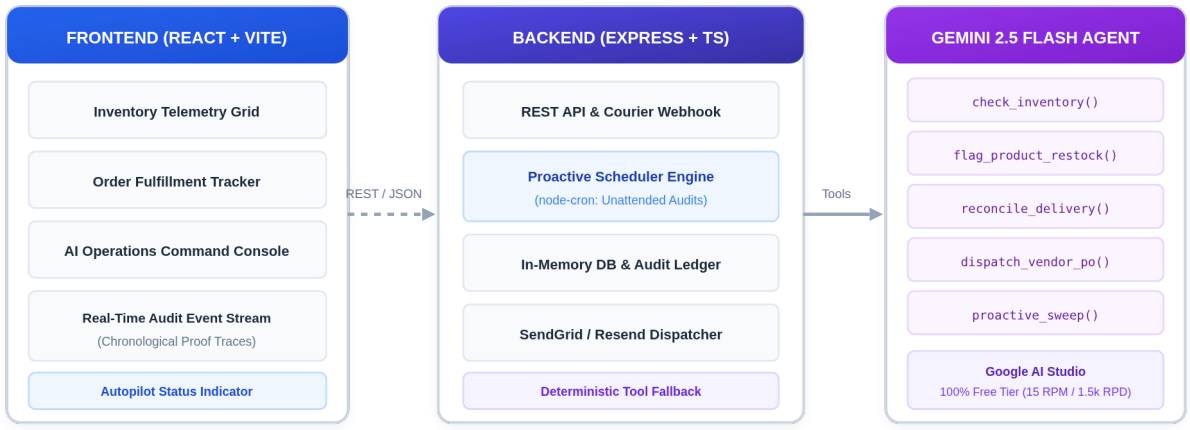

To construct a high-impact agent, the human operations role was decomposed into granular sub-functionalities and prioritized using an *Impact vs. Complexity* scoring model:

SUB-FUNCTIONALITY	OPERATIONAL RESPONSIBILITY	COMPLEXITY	PRIORITY	LEVEL 1
Stockout Guard & Auto-Flagging	Evaluates inventory vs. safety stock; automatically updates merchant dashboard to `RESTOCK_NEEDED` with urgency ratings.	Medium	`P0 (Critical)`	`Shipped`
Carrier Proof-of-Delivery Sync	Ingests 3PL tracking webhooks; uses Gemini to parse proof notes; autonomously mutates order status to `DELIVERED`.	Medium	`P0 (Critical)`	`Shipped`
Gemini Function Calling Engine	Structured tool execution loop orchestrating database mutations, parameter validations, and transactional dispatches.	Medium	`P0 (Critical)`	`Shipped`
Proactive Background Auditor	Scheduled background cron sweeps detecting stalled in-transit shipments (>24h) and unflagged depleted SKUs.	Low	`P1 (Core)`	`Shipped`
Supplier Purchase Order Dispatch	Auto-generates formal HTML purchase orders with wholesale pricing calculations and emails vendors via SendGrid/Resend.	Low	`P1 (Core)`	`Shipped`
Interactive Full-Stack UI	Responsive React dashboard featuring real-time telemetry, audit trails, and a natural language command console.	Medium	`P1 (Core)`	`Shipped`
Multi-Courier Route Optimization	Dynamically assigns couriers based on geographic traffic patterns and historical carrier SLAs.	High	`P2 (Roadmap)`	Deferred

3. High-Level Technical Architecture & System Blueprint

The solution is implemented as a cohesive **TypeScript Monorepo**. It ensures end-to-end type safety between the frontend UI models, backend REST controllers, and Gemini function declaration contracts.

FIGURE 1: FULL-STACK COMPONENT INTERACTION & GEMINI TOOL CALLING PIPELINE

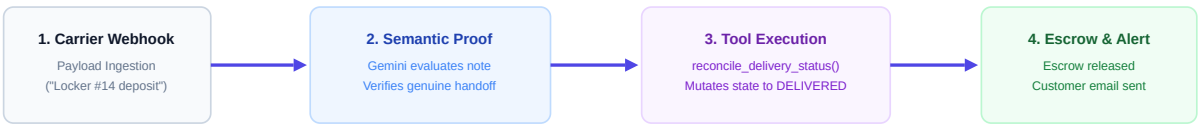

4. Core Operational Workflows & State Lifecycle

Workflow A: Carrier Delivery Reconciliation & Escrow Settlement

When a third-party courier completes a delivery, the agent receives an automated webhook payload or polls tracking manifests. Gemini processes the raw tracking payload and delivery proof note, validates successful delivery, and executes state mutation:

FIGURE 2: SEQUENCE LIFECYCLE FROM CARRIER WEBHOOK TO CUSTOMER CONFIRMATION

Workflow B: Inventory Telemetry & Autonomous Purchase Order Formulation

When customer purchases decrease stock below the reorder point, the agent activates the stockout guard. It applies classical supply chain inventory math to determine optimal replenishment quantities:

> **Reorder Point (ROP) & Safety Stock Formula:**
> `ROP = (Average Daily Sales × Lead Time in Days) + Safety Margin`
> When `Current Stock ≤ ROP`, the agent mutates the merchant catalog status to `RESTOCK_NEEDED` with an urgency tier:
>
> - `Current Stock == 0` → **CRITICAL** urgency (immediate stockout).
> - `Current Stock ≤ (ROP / 2)` → **HIGH** urgency.
> - `Current Stock ≤ ROP` → **MEDIUM** urgency.

5. Strongly-Typed Gemini Tool Calling Contracts

The agent is equipped with 5 registered function declarations defined in Google AI Studio:

```
// TOOL 1: check_inventory_levels
{
  "name": "check_inventory_levels",
  "description": "Scans all SKU balances, safety margins, and active restock flags.",
  "parameters": {
    "type": "OBJECT",
    "properties": {
      "filter": { "type": "STRING", "enum": ["ALL", "LOW_STOCK_ONLY", "FLAGGED_ONLY"] }
    }
  }
}

// TOOL 2: flag_product_for_restock
{
  "name": "flag_product_for_restock",
  "description": "Sets RESTOCK_NEEDED flag on the merchant portal with priority rating.",
  "parameters": {
    "type": "OBJECT",
    "properties": {
      "productIdOrSku": { "type": "STRING", "description": "Product ID or unique SKU" },
      "urgency": { "type": "STRING", "enum": ["LOW", "MEDIUM", "CRITICAL"] },
      "reason": { "type": "STRING", "description": "Justification for flag mutation" }
    },
    "required": ["productIdOrSku", "urgency", "reason"]
  }
}

// TOOL 3: reconcile_delivery_status
{
  "name": "reconcile_delivery_status",
  "description": "Mutates order lifecycle from IN_TRANSIT to DELIVERED based on courier proof.",
  "parameters": {
    "type": "OBJECT",
    "properties": {
      "orderIdentifier": { "type": "STRING", "description": "Order ID, Order Number, or Tracking #
      "deliveryNotes": { "type": "STRING", "description": "Proof of delivery or carrier signature
    },
    "required": ["orderIdentifier", "deliveryNotes"]
  }
}

// TOOL 4: dispatch_vendor_restock_email
{
  "name": "dispatch_vendor_restock_email",
  "description": "Formulates formal PO and sends supplier requisition email via SendGrid/Resend.",
  "parameters": {
    "type": "OBJECT",
    "properties": {
      "productIdOrSku": { "type": "STRING" },
      "quantity": { "type": "NUMBER", "description": "Wholesale replenishment units" },
      "instructions": { "type": "STRING", "description": "Shipping/billing instructions" }
    },
    "required": ["productIdOrSku", "quantity"]
  }
}

// TOOL 5: trigger_proactive_audit_sweep
{
  "name": "trigger_proactive_audit_sweep",
  "description": "Manually triggers unattended background sweep across catalog SKUs and active shi
```

```
  "parameters": { "type": "OBJECT", "properties": {} }
}
```

6. Free-Tier Compliance & Resource Verification

The solution was specifically designed to operate entirely within **Always Free Tiers** without requiring a credit card or billing account:

SERVICE	ARCHITECTURAL PURPOSE	FREE TIER QUOTA & LIMIT	COST
Google Gemini 2.5 Flash	Core semantic reasoning, intent parsing, and tool-calling execution.	Google AI Studio Free Tier (15 requests/min, 1,500 requests/day).	**$0.00** (No card required)
SendGrid / Resend API	Transactional supplier purchase orders and customer delivery confirmation emails.	Free Developer Tier (100 emails/day, no credit card required).	**$0.00** (Free Tier)
3PL Courier Webhook Simulator	Ingests carrier events and proof-of-delivery notes adhering to universal logistics standards.	Embedded local webhook engine (DHL/17Track compatible).	**$0.00** (Local runtime)
Proactive Cron Engine	Unattended background sweeps and anomaly detection.	node-cron (Local / GCP Cloud Run Always Free: 180k vCPU-sec/mo).	**$0.00** (Always Free)

7. Demonstration Test Cases & Video Script Guide

1. **Test Case 1 (Autonomous Stockout Guard):** In the Inventory Guard table, locate a healthy product (e.g., *ErgoDynamic Office Chair*). Click "Sell 1" until units drop below safety threshold. Observe the agent autonomously flag the item as `RESTOCK_NEEDED` on the dashboard, update the live audit feed, and formulate a supplier purchase order.
2. **Test Case 2 (Carrier Proof Reconciliation):** In the Fulfillment Pipeline table, find an order in `IN_TRANSIT`. Click "Simulate Delivery" (triggering an incoming 3PL carrier webhook). Observe Gemini validate the proof note and autonomously transition the order to `DELIVERED` with an "AI Reconciled" badge.
3. **Test Case 3 (Proactive Background Sweep):** Click "Run Proactive Audit" in the header navigation. Verify that the agent audits all catalog items, evaluates delayed in-transit shipments (>24h), and logs a consolidated operations digest.
